Cell Biology: The Building Blocks of Life

Cells are the fundamental units of life. Understanding their structure and functions is crucial in biology.

Types of Cells

There are two main types:

- **Prokaryotic Cells:** Simpler, no nucleus (e.g., bacteria).

- **Eukaryotic Cells:** More complex, with a nucleus (e.g., plant and animal cells).

Key Organelles and Their Functions

A typical eukaryotic cell contains:

Genetics: The Blueprint of Life

Genetics studies how traits are inherited and variations occur within populations.

DNA Structure and Function

DNA (Deoxyribonucleic acid) is the molecule that carries genetic information.

- Dominant traits mask recessive ones in heterozygous individuals.
- Recessive traits only appear when two recessive alleles are present.

Genetic Variation and Mutation

- Mutations are changes in DNA sequences that can introduce new traits.
- Genetic variation is essential for evolution and adaptation.

Evolution and Natural Selection

Evolution explains how species change over time due to genetic variations and environmental pressures.

Darwin?s Theory of Evolution

- Organisms produce more offspring than can survive.
- Variations exist within populations.
- Those with advantageous traits are more likely to survive and reproduce.
- Over generations, these traits become more common.

Mechanisms of Evolution

- **Natural selection:** Differential survival based on traits.
- **Genetic drift:** Random changes in allele frequencies.
- **Gene flow:** Movement of genes between populations.
